PTM: Contains a covalently attached chromophore, which is composed of modified amino acid residues. The chromophore is formed upon cyclization of the residues Ser-dehydroTyr-GIV.

-i. BIOTECHNOLOGY: Has become a useful and ubiquitous tool for making chimeric proteins of GFP linked to other proteins where it functions as a fluorescent protein tag. GFP tolerates N-and C-terminal fusion to a broad variety of proteins. It has been expressed in bacteria, yeast, slime mold, plants, Drosophila, zebrafish, and in mammalian cells. As a noninvasive fluorescent marker in living cells, it allows for a wide range of applications where it may function as a cell lineage tracer, reporter of gene expression, or as a measure of protein-protein interactions.

Blochemistry 38:526-5301 (1999).
-!- FUNCTION: Energy-transfer acceptor. Its role is to transduce the
blue chemiluminescence of the protein aquorin into green
fluorescent light by energy transfer. Fluoresces in vivo upon
receiving energy from the Ca(2+)-activated photoprotein aequorin.
Absorbs light maximally at 395 nm and exhibits a smaller
absorbance peak at 470 nm. The fluorescence emission spectrum
peaks at 509 nm with a shoulder at 540 nm.

Dong U., Gu T.T., Simmons D., MacDougall M.;
Enamelin maps to human chromosome 4q21 within the autosomal dominant amelogenesis imperfecta locus.";
Eur. J. Oral Sci. 108:353-358(2000).
-: FUNCTION: Involved in the mineralization and structural organization of enamel. Involved in the extension of enamel during the secretory stage of dental enamel formation.
-: SUBCELEULAR LOCATION: Secreted; extracellular matrix.
-: TISSUE SPECIFICITY: Expressed in tooth particularly in odontoblast, ameloblast and cementoblast.

"Reblin controls position of autonomic neurons in the spinal cord.";

Proc. Natl. Acad. Sci. U.S.A. 97:8612-8616(2000).

-I- FUNCTION: Extracellular matrix serine protesse that plays a role in layering of neurons in the cerebral cortex and cerebellum.

Regulates microtubule function in neurons and neuronal migration.

Affects migration of sympathetic preganglionic neurons in the spinal cord, where it seems to act as a barrier to neuronal migration. Affects migration cativity is important for the modulation of call adhesion. Binding to the extracellular domains of lipoprotein migration. Brinding to the extracellular domains of lipoprotein cativity is almost of Tau phosphorylation of Dabl and modulation of Tau phosphorylation.

-I- SUBNOIT: Binds to the ectodomains of VLDLR and ApoER2.

-I- SUBCELLULAR LOCATION: Secreted.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               -i- FUNCTION: Essential for photosystem II (PSII) biogenesis; putative protein stability or assembly factor for PSII.
-!- SUBCELDULAR LOCATION: Chloroplast; within the thylakoid lumen but attached to the membrane. Restricted to the stromal lamelae.
-!- TISSUB SPECIFICITY: Expression in green tissue, not roots.
-!- DEVELOPMENTAL STAGE: Accumulates also in dark-grown seedlings.
-!- SIMILARITY: Belongs to the ycf48 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        74 --IPD----YVKQSFPGRYTWERIMNFEDGAVCTVSNDSSIQGNCFIYHVKFSGLNFPPN

PIN: The protein may be posttranslationally processed into cytochrome cl and b.

SIMILARITY: Belongs to the cytochrome b family.
                                                                                                                                                             Thoeny-Meyer L., Stax D., Hennecke H.;

-!- FUNCTION: This polymerase possesses two enzymatic activities: DNA synthesis (polymerase) and an exonucleolytic activity that degrades single stranded DNA in the 3' to 5' direction.
-!- CAȚALYȚIC ACTIVITY: N deoxynucleoside triphosphate = N diphosphate
                                                                                                                                                                                                    X-RAY CRYSTALLOGRAPHY (2.2 ANGSTROMS) OF 1-388.

In layering of neurons in the cerebral cortex and cerebellum. Regulates microtubule function in neurons and neuronal migration. Affects migration of sympathetic preganglionic neurons in the spinal cord, where it seems to act as a barrier to neuronal migration. Enzymatic activity is important for the modulation of cell adhesion. Binding to the extracellular domains of lipoprotein receptors VLDIR and ApoERZ induces tyrosine phosphorylation of Dabl and modulation of Tau phosphorylation (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         DISEASE: Defects in Reln are the cause of creeping, which is characterized by tremor, gait ataxia, cerebellar hypoplasia and abnormal neuronal migration (particularly in the cerebral cortex and hippocampus). The mutation is due to a nucleotide insertion at codon 1892 which results in a translational frameshift and truncation of the protein family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   TISSUE SPECIFICITY: Abundantly produced during brain ontogenesis by the Cajal-Retzius cells and other pioneer neurons located in the telencephalic marginal zone and by granule cells of the external granular layer of the cereballum.

DOMAIN: The basic C-terminal region is essential for secretion (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Hydrolase; Serine procease; Developmental protein; Matrix protein;

The invention relates to an isolated colour-facilitating molecule (CFM) comprising a polypeptide which, in a cell, alone or together with one or more other molecules imparts an altered visual characteristic to the cell when visualised by a human eye in the absence of excitation by extraneous non-white light or particle emission. CFMs are useful for producing a transgenic animal which exhibits a novel colour e.g. sheep with blue or red coloured fleece. They are useful for producing coloured plant extracts, e.g. flavouring, beverage or juice or colouring agent. Other uses include transducing or intensifying an image, providing additional light for growing phototropic organisms e.g. algae and/or corals, for coating materials that experience UV damage e.g. plaatics and car upholstery. CFMs are useful in the flower industry, in the development of heaversian material plants. Other contemplated uses include,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            expression markers, general reporter molecules, photon traps, UV sinks or in unscreens. CPMs modify visible colour in edible and/or ornamental fungal species, and in fruits and vegetables to enhance their marketability. CFMs embedded in a gel matrix improve image quality in situations of distorted light spectra (blomatix). The first all-protein chromophore to be isolated was Green Fluorescent protein (GFP). The sequences given in records ABP69924-ABP70048 represent CFM related amino
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             QYGSIPFTKYPEDIPDYVKQSFPGRYTWERIMNFEDGAVCTVSNDSSIQGNCFIYHVKFS 120

                                       cDNA libraries were constructed from a blue pigmented coral, Acropora aspera to isolate sequences encoding polypeptides with N-terminal sequences as shown in AAY97147-48. Pigment protein from coral tissue (PPCT) is capable of emitting fluorescence upon irradiation by incident light whose maximal absorbance is in the range of 320-600 nm and a maximal fluorescence emission is in the range of 300-700 nm. PPCT may be used as a tissue marker, fluorescent marker (e.g. to follow gene expression in transformed tissues) or general dyscuff (all claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               9

when visualised by a human eye in the absence of excitation by extraneous non-white light or particle emission. CFMs are useful for producing a transgenic animal which exhibits a novel colour e.g. sheep with blue or red coloured fleece. They are useful for producing coloured plant extracts, e.g. flavouring, beverage or juice or colouring agent. Other uses include transducing or intensifying an image, providing additional light for growing phototropic organisms e.g. algae and/or corals, for coating materials that experience UV damage e.g. plastics and car upholstery. CFMs are useful in the flower industry, in the development of new varieties of flowering plants. Other contemplated uses include,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                expression markers, general reporter molecules, photon traps, UV sinks or in sunscreens. CFMs modify visible colour in edible and/or ornamental fungal species, and in fruits and vegetables to enhance their marketability. CFMs embedded in a gel martix improve image quality in situations of distorted light spectra (blomatrix). The first all-protein sequences given in records ABS6924.ABP70048 represent (GFP). The sequences (Updated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated colour-facilitating molecule (CFM) comprising a polypeptide which, in a cell, alone or together with one or more other molecules imparts an altered visual characteristic to the cell
                                                                                                                                                                                                                                                                                                                      Novel color-facilitating molecule for producing a biomatrix, has a polypeptide which alone/along with molecules imparts altered visual characteristics to cells in the absence of excitation by extraneous non-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   рe
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cDNA libraries were constructed from a blue pigmented coral, Acropora aspera to isolate sequences encoding polypeptides with N-terminal sequences as shown in AAY97147-48. Pigment protein from coral tissue (PPCT) is capable of emitting fluorescence upon irradiation by incident light whose maximal absorbance is in the range of 320-600 nm and a maximal fluorescence emission is in the range of 300-700 nm. PPCT may used as a tissue marker, fluorescent marker (e.g. to follow gene expression in transformed tissues) or general dyestuff (all claimed).

PPCT may also be used in sunscreen formulations or UV filters (both
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   61 QYGSIPFTKYPEDIPDYVKQSFPGRYTWERIMNFEDGAVCTVSNDSSIQGNCFIYHVKFS

```

The invention relates to an isolated colour-facilitating molecule (CFM)

comprising a polypeptide which, in a cell, alone or together with one or

contex molecules imparts an altered visual characteristic to the cell

when visualised by a human eye in the absence of excitation by extraneous

con-white light or particle emission. CFMs are useful for producing a

cransgenic animal which exhibits a novel colour e.g. sheep with blue or

red coloured fleece. They are useful for producing coloured plant

extracts, e.g. flavouring, beverage or juice or colouring agent. Other

cuses include transducing or intensifying an image, providing additional

clight for growing phototropic organisms e.g. algae and/or corals, for

coating materials that experience UV damage e.g. plastics and car

couloursters. CFMs are useful in the flower industry, in the development of

coating markers, general reporter molecules, photon traps, UV sinks or

composite to filowering plants. Other contemplated uses include,

expression markers, general reporter molecules, photon traps, UV sinks or

composite to filowering plants of colour in edible and/or ornamental

changed species, and in fruits and vegetables to enhance their

chromophore to be isolated was Green Fluorescent protein

chromophore to be isolated was Green Fluorescent protein

chromophore given in records ABPG0924-ABP71048 represent CFM related amino

code acid sequences given in records ABPG0924-ABP71048 represent CFM related amino

light for growing phototropic organisms e.g. algae and/or corals, coating materials that experience UV damage e.g. plastics and car coating materials that experience UV damage e.g. plastics and car coating materials that experience UV damage e.g. plastics and car new varieties of flowering plants. Other contemplated uses include, expression markers, general reporter molecules, photon traps, UV sinks or in sunscreens. CPMs modify visible colour in edible and/or ornamental fungal species, and in fruits and vegetables to enhance their marketability. CPMs embedded in a gel matrix improve image quality in situations of distorted light spectra (biomatrix). The first all-protein sequences given in records ABP69924 ABP70048 represent (GPP). The sequences in records ABP69924 ABP70048 represent (GPP) in a cid sequences. (Updated on 06-AUG-2003 to correct OS field.) uses include transducing or intensifying an image, providing additional 555555555555555%%

The invention relates to an isolated colour-facilitating molecule (CFM)

comprising a polypeptide which, in a cell, alone or together with one or

core other molecules imparts an altered visual characteristic to the cell

when visualised by a human ey in the absence of excitation by extraneous

con-white light or particle emission. CFMs are useful for producing a

cranspanic animal which exhibits a novel colour e.g. sheep with blue or

red coloured fleece. They are useful for producing coloured plant

catracts, e.g. flavouring, beverage or juice or colouring agent. Other

extracts, e.g. flavouring or intensifying an image, providing additional

clight for growing phototropic organisms e.g. algae and/or corals, for

coating materials that experience UV damage e.g. plastics and car

conting materials that experience UV damage e.g. plastics and car

The invention relates to an isolated colour-facilitating molecule (CFM) comprising a polypeptide which, in a cell, alone or together with one or more other molecules imparts an altered visual characteristic to the cell when visualised by a human eye in the absence of excitation by extraneous non-white light or particle emission. CFMs are useful for producing a transgenic animal which exhibits a novel colour e.g. sheep with blue or red coloured fleece. They are useful for producing coloured plant extracts, e.g. flavouring, beverage or juice or colouring agent. Other uses include transducing or intensifying an image, providing additional light for growing phototropic organisms e.g. algae and/or corals, for coating materials that experience UV damage e.g. plastics and car upholstery. CFMs are useful in the flower industry, in the development of new varieties of flowering plants. Other contemplated uses include, expression markers, general reporter molecules, photon traps, UV sinks or in sunscreens. CFMs modify visible colour in edible and/or ornamental fungal species and in fruits and vegetables to enhance their marketability. CFMs embedded in a gel matrix improve image quality in situations of distorted light spectra (biomatrix). The first all-protein chromopolic to be isolated was Green Fluorescent protein (FFP). The seminary of throughore to be isolated was Green Fluorescent protein (FFP). The seminary of the protein of the model of the protein of the market of the protein of the protein of the colour in the protein of the pr sequences given in records ABP69924-ABP70048 represent CFM related amino

transgenic animal which exhibite a novel colour e.g., sheep with blue or red coloured fleece. They are useful for producing coloured plant extracts, e.g. flavouring, beverage or juice or colouring agent. Other uses include transducing or intensifying an image, providing additional light for growing phototropic organisms e.g. algae and/or corals, for coating materials that experience UV damage e.g. plastics and car upholstery. CFMS are useful in the flower industry, in the development of new varieties of flowering plants. Other contemplated uses include, expression markers, general reporter molecules, photon traps, UV sinks or in sunscreens. CFMS modify visible colour in edible and/or ornamental fungal species, and in fruits and vegetables to enhance their marketability. CFMs embedded in a gel matrix improve image quality in chromophore to be isolated was Green Fluorescent protein (GFP). The chromophore given in records ABBF69924ABP70048 represent CFM related amino acid sequences given in records ABBF69924ABP70048 represent CFM related amino

The invention relates to an isolated colour-facilitating molecule (CFW) comprising a polypeptide which, in a cell, alone or together with one or more other molecules imparts an altered visual characteristic to the cell when visualised by a human eye in the absence of excitation by extraneous non-white light or particle emission. CFMs are useful for producing a cransgenic animal which exhibits a novel colour e.g. sheep with blue or red coloured fleece. They are useful for producing coloured plant extracts, e.g. flavouring, beverage or juice or colouring agent. Other extracts, e.g. flavouring, beverage or juice or colouring agent. Other cuses include transducing or intensifying an image, providing additional light for growing phototropic organisms e.g. algae and/or corals, for coating materials that experience UV damage e.g. plastics and car upholstery. CFMs are useful in the flower industry, in the development of new varieties of flowering plants. Other contemplated uses include, expression markers, general reporter molecules, photon traps, UV sinks or in sunscreens. CFMs embedded in a gel matrix improve image quality in characteris in sunscreens given in fruits and vegetables to enhance their marketablity. CFMs embedded in a gel matrix improve image quality in chromations of distorted light spectra (biomatrix). The first all-protein chromophore to be isolated was Green Fluorescent protein (GFP). The sequences given in records ABSE6924-ABPPONGES represent CFM related amino acid sequences. (Updated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         QYGSIPFTKYPEDIPDYVKQSFPGRYTWERIMNFEDGAVCTVSNDSSIQGNCFIYHVKFS 120

The invention relates to an isolated colour-facilitating molecule (CFM)

comprising a polypeptide which, in a cell, alone or together with one or

more other molecules imparts an altered visual characteristic to the cell

when visualised by a human eye in the absence of excitation by extraneous

con-white light or particle emission. CFMs are useful for producing a

transgenic animal which exhibits a novel colour e.g. sheep with blue or

cet coloured fleece. They are useful for producing coloured plant

extracts, e.g. flavouring, beverage or juice or colouring agent. Other

cet coloured fleece. They are useful for producing agent. Other

light for growing phototropic organisms e.g. algae and/or corals, for

coating materials that experience UV demage e.g. plastics and car

coating materials that experience uV demage e.g. plastics and car

conting markers, general reporter molecules, photon traps, UV sinks or

conting markers, general reporter molecules, photon traps, UV sinks or

in sunscreens. CFMs modify visible colour in edible and/or ornamental

conting species, and in fruits and vegetables to enhance their

conting and reporter and plants: Or enhance their

conting and reporter and reporter misers and are contained the species and are all protesion

contained to be isolated was green fluorescent protein (GFP). The

The invention relates to an isolated colour-facilitating molecule (CFM)

comprising a polypeptide which, in a cell, alone or together with one or

more other molecules imparts an altered visual characteristic to the cell

when visualised by a human eye in the absence of excitation by extraneous

non-white light or particle emission. CFMs are useful for producing a

cransgenic animal which exhibits a novel colour e.g. sheep with blue or

red coloured fleece. They are useful for producing coloured plant

extracts, e.g. flavouring, beverage or juice or colouring agent. Other

extracts, e.g. flavouring, beverage or juice or colouring agent. Other

cotting materials that experience UV damage e.g. plastics and car

cotting materials that experience UV damage e.g. plastics and car

cotting materials that experience UV damage e.g. plastics and car

cotting materials that experience UV damage e.g. plastics and car

conting materials flowering plants. Other contemplated uses include,

new varieties of flowering plants. Other contemplated uses include,

expression markers, general reporter molecules, photon traps, UV sinks or

conting materials and in fruits and vegetables to enhance their

marketability. CFMs embedded in a gel matrix improve image quality in

chromophore to be isolated was Green Fluorescent protein (GFP). The

chromophore to be isolated was Green Fluorescent protein (GFP). The

caid sequences given in records ABBF0924-ABP70048 represent CF first all-protein

caid sequences. (Updated on 06-AUG-2003 to correct OS field.) Novel color-facilitating molecule for producing a biomatrix, has a polypeptide which alone/along with molecules imparts altered visual characteristics to cells in the absence of excitation by extraneous non-Colour facilitating molecule; CFM; green fluorescent protein; GFP; chromophore; biomatrix; transgenic animal; colouring agent; flower industry; expression marker; reporter molecule; photon trap; Colour Facilitating molecule (CFM) related sequence #SEQ ID 102. in sunscreens. CFMs modify visible colour in edible and/or ornamental fungal species, and in fruits and vegetables to enhance their marketability. CFMs embedded in a gel matrix improve image quality in situations of distorted light spectra (biomatrix). The first all-protein chromophore to be isolated was Green Fluorescent protein (GFP). The sequences given in records ABP69924-ABP70048 represent CFM related amino acid sequences. (Updated on 06-AUG-2003 to correct OS field.)

The invention relates to an isolated colour-facilitating molecule (CFW) comprising a polypeptide which, in a cell, alone or together with one or more other molecules imparts an altered visual characteristic to the cell when visualised by a human eye in the absence of excitation by extraneous non-white light or particle emission. CFMs are useful for producing a transgenic animal which exhibits a novel colour e.g. sheep with blue or ed coloured fleece. They are useful for producing coloured plant extracts, e.g. flavouring, beverage or juice or colouring agent. Other uses include transducing or intensifying an image, providing additional light for growing phototropic organisms e.g. algae and/or corals, for coating materials that experience UV damage e.g. plastics and car upholstery. CFMs are useful in the flower industry, in the development of new varieties of flowering plants. Other contemplated uses include, expression markers, general reporter molecules, photon traps, UV sinks or
